

SNOWSOUND-FIBER

SOUND-ABSORBING ACOUSTIC FABRICS

Snowsound-Fiber by Caimi Brevetti is a range of sound-absorbing acoustic fabrics that merge excellent sound performance with a wonderful feel - including different texture perceptions - and beautiful aesthetics.

Snowsound-Fiber patented technology grew out of research commenced in 2011 by Caimi Brevetti into acoustic design as it sought to minimize the discomfort caused by sound vibrations in the workplace and elsewhere. Based on soft interwoven polyester fibers that are naturally fire resistant, Snowsound-Fiber technology is a quick, simple way to improve the sound of new and old rooms. The range of materials can easily fit into most furnishing projects, adding color and texture to a room.

The interaction between the fibers in the fabric and the air makes it possible to control reverberation and precisely regulate the acoustic response of a room, varying the effect through placement, fabric area and fabric-wall distance. At the core of this lies a series of calculations by Caimi Brevetti that make such precision numerical. Absorption can target specific frequencies - low, medium, high - or uniformly absorb all frequencies. Snowsound-Fiber products are Greenguard Gold certified, counting towards the Indoor Environmental Quality score in LEED assessment. All Snowsound-Fiber acoustic fiber fabrics are 100% recyclable, and can be washed and ironed without damaging the fire retardant and anti-bacterial properties.
